Solar Algae Dryer

How it works 1. Pouring algae-water solution in tank 1 2. The distilling process starts because of the sunbeams 1111 3a. The temperature gets 3. The level of the remaining algae reaches a certain point to a higher level then 50°C. 4a. The blinds close to screen 4. The blinds close so the distilling the sun from the tank. process stops. A LED lamp lights up Valve 1 5. The user opens valve 2 and 3. 5a. Temperature is below 50°C. He removes tank 2 and 3 Tank 1 so the algae and water can be collected separately. 6a. Blinds open and the process continues. See step 3. Valve 2 Valve 3 Tank 2 Tank 3
